

**Supplementary Figure 3.** Kaplan-Meier analysis of the cumulative probability of hepatic decompensation in the (A) derivation and (B) validation cohorts from liver stiffness measurement cohort. As the cutoff points (3.5 and 10 mmol/L) were selected out, the probability of hepatic decompensation was compared in patients with urea level  $\leq 3.5$  mmol/L (low level), 3.6–9.9 mmol/L (moderate level), and  $>10$  mmol/L (high level) in the derivation and validation cohorts.
