

Supplementary Figure 1. Serum MPO-DNA level in alcoholic liver disease (ALD), hepatocellular carcinoma (HCC), and ALD+HCC patients. Liver MPO-DNA levels in the mouse models of alcoholic hepatosteatosis and HCC were detected by ELISA. (A) Subgroup analysis of the MPO-DNA level according to whether the patients were with or without liver cirrhosis. (B) Subgroup analysis of the MPO-DNA level according to the tumor stage. OD, optical density.
