

A. Liver biopsy-based outcomes

(a) Fibrosis stage (9 studies)

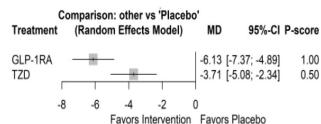

(a\*) Fibrosis stage (5 studies)

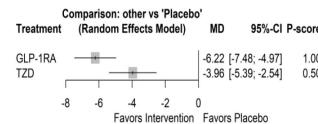

B. Non-invasive technique-based outcomes

(a) Liver fat contents by  $^1\text{H}$ -MRS (5 studies)

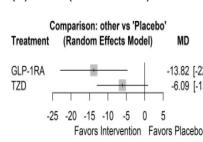

(a\*) Liver fat contents by  $^1\text{H}$ -MRS (4 studies)

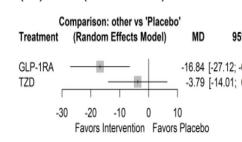

C. Biological and anthropometric outcomes

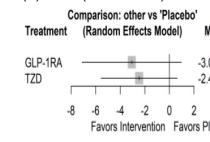

(a) ALT (19 studies)

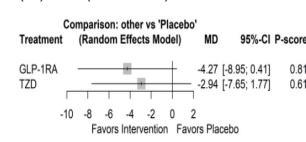

(a\*) ALT (12 studies)

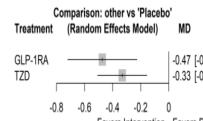

(b) AST (18 studies)

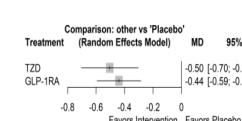

(b\*) AST (12 studies)

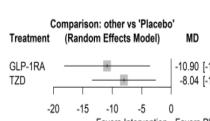

(c) HbA1c (17 studies)

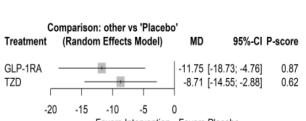

(c\*) HbA1c (12 studies)

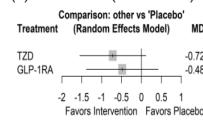

(d) FPG (23 studies)

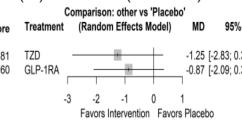

(d\*) FPG (16 studies)

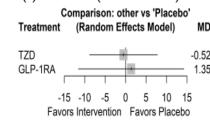

(e) HOMA-IR (12 studies)

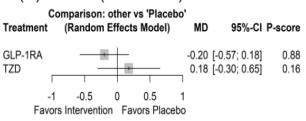

(e\*) HOMA-IR (7 studies)

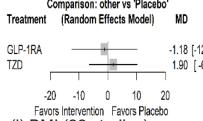

(f) T-Chol (16 studies)

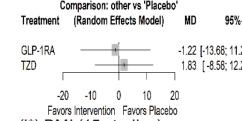

(f\*) T-Chol (13 studies)

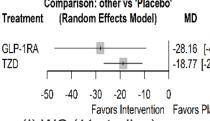

(g) LDL-C (15 studies)

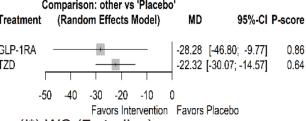

(g\*) LDL-C (13 studies)

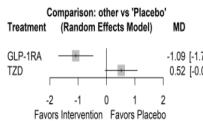

(h) TG (17 studies)

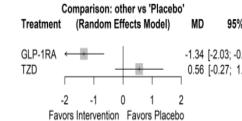

(h\*) TG (14 studies)

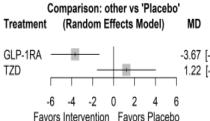

(i) BMI (22 studies)

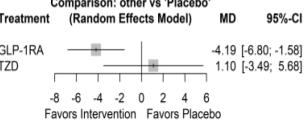

(i\*) BMI (15 studies)

(j) WC (11 studies)

(j\*) WC (7 studies)

**Supplementary Material 8. Sensitivity analysis.** Sensitivity analysis was conducted after excluding six articles with a high risk for bias.

(A) Forest plots of the original and sensitivity analyses (\*). ALT, alanine aminotransferase; AST, aspartate aminotransferase; BMI, body mass index; FPG, fasting plasma glucose; GLP-1RA, glucagon-like peptide-1 receptor agonist;  $^1\text{H}$ -MRS, proton magnetic resonance spectroscopy; HOMA-IR, homeostasis model assessment of insulin resistance; LDL-C, low-density lipoprotein-cholesterol; MD, mean difference; T-Chol, total cholesterol; TG, triglyceride; TZD, thiazolidinedione; WC, waist circumference. Sensitivity analysis was not performed in some outcomes because of the small number of studies remaining (NAS), and there were no studies with a high risk of bias (NASH resolution, liver fat contents by CAP). All sensitivity analysis results showed a low possibility of heterogeneity, inconsistency, and publication bias.

**Supplementary Material 8.** Continued

Network meta estimates	Original	Sensitivity
Fibrosis stage	9 studies	5 studies
GLP-1RA vs. placebo	-0.40 (-1.21; 0.41)	-0.40 (-1.06; 0.26)
